

1. What I have done

- Implemented similarity search and made it accessible from the museum through a popup-based workflow.
- Added vector values from vitivr to displayed media nodes so that similarity searches can be started from existing results.
- Refactored the Godot-side code and backend integration.
- Added hand tracking support for Meta Quest 3, including switching between controller and hand tracking modes for on-device usage and streaming. Some errors still remain.
- Improved visual quality and reduced warnings, with the tradeoff of lower performance.
- Spent significant time investigating how to export a runnable Godot build for Apple Vision Pro.
- Created first evaluation points and uploaded the German evaluation concept.
- Added templates for the midterm presentation and the written report.

2. Where I need support

- Access to a Vive XR Elite headset for testing.
- Access to more videos and 3D assets.
- Feedback on the planned evaluation points.
- .NET xrOS integration is not available yet, so we need to find a way to test the Apple Vision Pro. Maybe streaming over ALVR?

3. What I am planning to do for the next meeting

- ☐ Test streaming to the Apple Vision Pro
- ☐ Create a new room for original-size 3D assets
- ☐ Test hand tracking on additional devices
- ☐ Fix remaining hand tracking and input mode issues
- ☐ Prepare for the midterm presentation
