

1. What I have done

- Successfully deployed and tested the prototype on the Vive headset.
- Improved the frame scaling logic so that all frame borders now maintain a consistent thickness independent of the image aspect ratio.
- Refactored and cleaned up parts of the Godot project structure.
- Tested vitrivr on the server environment.
- Updated the menu so now you can decide if the museum runs in local mode (using vitrivr in docker desktop and the flask server) or in server mode (via the vpn and vitriver running on the server and getting images from the laptop).

2. Where I need support

- nginx is installed but how do i configure it to serve the images from the vitrivr engine?
- Access to a Vive XR Elite headset

3. What I am planning to do for the next meeting

☐ Test nginx integration

☐ Continue Code Cleanup

☐ Improve VR museum environment (lighting, assets)

☐ Add multiple image result support

☐ Prepare for the next weekly meeting
